### Sorting problem

**Ex.** Student records in a university.

<table>
<thead>
<tr>
<th>Item</th>
<th>Key</th>
<th>Key Value</th>
<th>Address</th>
</tr>
</thead>
<tbody>
<tr>
<td>Chen</td>
<td>A</td>
<td>991-878-4944</td>
<td>308 Blair</td>
</tr>
<tr>
<td>Rohde</td>
<td>A</td>
<td>232-343-5555</td>
<td>343 Forbes</td>
</tr>
<tr>

</table>
Sample sort client 1

**Goal.** Sort any type of data.

**Ex 1.** Sort random real numbers in ascending order.

```java
public class Experiment {
    public static void main(String[] args) {
        int N = Integer.parseInt(args[0]);
        Double[] a = new Double[N];
        for (int i = 0; i < N; i++)
            a[i] = StdRandom.uniform();
        Insertion.sort(a);
        for (int i = 0; i < N; i++)
            StdOut.println(a[i]);
    }
}
```

% java Experiment 10
0.08614716385210452
0.09054270895414829
0.10708746304898642
0.21166190071646818
0.363292849257276
0.460954145685913
0.5340026311350087
0.7216129793703496
0.9003500354411443
0.9293994908845686

seems artificial, but stay tuned for an application
Sample sort client 2

**Goal.** Sort any type of data.

**Ex 2.** Sort strings from file in alphabetical order.

```java
public class StringSorter {
   public static void main(String[] args) {
      String[] a = In.readStrings(args[0]);
      Insertion.sort(a);
      for (int i = 0; i < a.length; i++)
         StdOut.println(a[i]);
   }
}
```

% more words3.txt
bed bug dad yet zoo ... all bad yes

% java StringSorter words3.txt
all bad bed bug dad ... yes yet zoo
Sample sort client 3

**Goal.** Sort any type of data.

**Ex 3.** Sort the files in a given directory by filename.

```java
import java.io.File;
public class FileSorter
{
   public static void main(String[] args)
   {
      File directory = new File(args[0]);
      File[] files = directory.listFiles();
      Insertion.sort(files);
      for (int i = 0; i < files.length; i++)
         StdOut.println(files[i].getName());
   }
}
```

% java FileSorter .

Callbacks

**Goal.** Sort any type of data.

**Q.** How can `sort()` know how to compare data of type `Double`, `String`, and `java.io.File` without any information about the type of an item's key?

**Callback** = reference to executable code.
- Client passes array of objects to `sort()` function.
- The `sort()` function calls back object's `compareTo()` method as needed.

**Implementing callbacks.**
- Java: *interfaces*.
- C: function pointers.
- C++: class-type functors.
- C#: delegates.
- Python, Perl, ML, Javascript: first-class functions.
Callbacks: roadmap

**client**

```java
import java.io.File;
public class FileSorter
{
    public static void main(String[] args)
    {
        File directory = new File(args[0]);
        File[] files = directory.listFiles();
        Insertion.sort(files);
        for (int i = 0; i < files.length; i++)
            StdOut.println(files[i].getName());
    }
}
```

**Comparable interface (built in to Java)**

```java
public interface Comparable<Item>
{
    public int compareTo(Item that);
}
```

**object implementation**

```java
public class File
    implements Comparable<File>
{
    ...
    public int compareTo(File b)
    {
        ...
        return -1;
        ...
        return +1;
        ...
        return 0;
    }
}
```

**sort implementation**

```java
public static void sort(Comparable[] a)
{
    int N = a.length;
    for (int i = 0; i < N; i++)
        for (int j = i; j > 0; j--)
            if (a[j].compareTo(a[j-1]) < 0)
                exch(a, j, j-1);
        else break;
}
```

**key point: no dependence on File data type**
Total order

A total order is a binary relation $\leq$ that satisfies:

- **Antisymmetry**: if $v \leq w$ and $w \leq v$, then $v = w$.
- **Transitivity**: if $v \leq w$ and $w \leq x$, then $v \leq x$.
- **Totality**: either $v \leq w$ or $w \leq v$ or both.

**Ex.**

- Standard order for natural and real numbers.
- Chronological order for dates or times.
- Alphabetical order for strings.
- ...

violates totality: $(\text{Double.NaN} \leq \text{Double.NaN})$ is false

**Surprising but true.** The $\leq$ operator for double is not a total order. (!)
Comparable API

Implement `compareTo()` so that `v.compareTo(w)`

- Is a total order.
- Returns a negative integer, zero, or positive integer if `v` is less than, equal to, or greater than `w`, respectively.
- Throws an exception if incompatible types (or either is `null`).

Built-in comparable types. Integer, Double, String, Date, File, ...
User-defined comparable types. Implement the Comparable interface.
Implementing the Comparable interface

Date data type. Simplified version of java.util.Date.

```java
public class Date implements Comparable<Date> {
    private final int month, day, year;
    public Date(int m, int d, int y) {
        month = m;
        day   = d;
        year  = y;
    }
    public int compareTo(Date that) {
        if (this.year  < that.year ) return -1;
        if (this.year  > that.year ) return +1;
        if (this.month < that.month) return -1;
        if (this.month > that.month) return +1;
        if (this.day  < that.day  ) return -1;
        if (this.day  > that.day  ) return +1;
        return 0;
    }
}
```
Two useful sorting abstractions

**Helper functions.** Refer to data through compares and exchanges.

**Less.** Is item $v$ less than $w$?

```java
private static boolean less(Comparable v, Comparable w)
{  return v.compareTo(w) < 0;  }
```

**Exchange.** Swap item in array $a[]$ at index $i$ with the one at index $j$.

```java
private static void exch(Comparable[] a, int i, int j)
{
   Comparable swap = a[i];
   a[i] = a[j];
   a[j] = swap;
}
```
Goal. Test if an array is sorted.

```java
private static boolean isSorted(Comparable[] a) {
    for (int i = 1; i < a.length; i++)
        if (less(a[i], a[i-1])) return false;
    return true;
}
```

Q. If the sorting algorithm passes the test, did it correctly sort the array?
A.
2.1 Elementary sorts

- rules of the game
- selection sort
- insertion sort
- shellsort
- shuffling
- convex hull
2.1 Elementary Sorts

- rules of the game
- selection sort
- insertion sort
- shellsort
- shuffling
- convex hull
Selection sort demo

- In iteration $i$, find index $\min$ of smallest remaining entry.
- Swap $a[i]$ and $a[\min]$.
Selection sort

Algorithm. ↑ scans from left to right.

Invariants.
- Entries the left of ↑ (including ↑) fixed and in ascending order.
- No entry to right of ↑ is smaller than any entry to the left of ↑.
Selection sort inner loop

To maintain algorithm invariants:

- Move the pointer to the right.
  
  `i++;`

- Identify index of minimum entry on right.
  
  ```
  int min = i;
  for (int j = i+1; j < N; j++)
    if (less(a[j], a[min]))
      min = j;
  ```

- Exchange into position.
  
  `exch(a, i, min);`
Selection sort: Java implementation

```java
public class Selection {
    public static void sort(Comparable[] a) {
        int N = a.length;
        for (int i = 0; i < N; i++) {
            int min = i;
            for (int j = i+1; j < N; j++) {
                if (less(a[j], a[min])) {
                    min = j;
                }
            }
            exch(a, i, min);
        }
    }

    private static boolean less(Comparable v, Comparable w) {
        /* as before */
    }

    private static void exch(Comparable[] a, int i, int j) {
        /* as before */
    }
}
```
Proposition. Selection sort uses \((N - 1) + (N - 2) + ... + 1 + 0 \sim N^2 / 2\) compares and \(N\) exchanges.

- convex hull
2.1 Elementary Sorts

- rules of the game
- selection sort
- insertion sort
- shellsort
- shuffling
- convex hull
Insertion sort demo

- In iteration $i$, swap $a[i]$ with each larger entry to its left.
Insertion sort

Algorithm. ↑ scans from left to right.

Invariants.
- Entries to the left of ↑ (including ↑) are in ascending order.
- Entries to the right of ↑ have not yet been seen.
Insertion sort inner loop

To maintain algorithm invariants:

- Move the pointer to the right.

```java
i++;
```

- Moving from right to left, exchange `a[i]` with each larger entry to its left.

```java
for (int j = i; j > 0; j--)
    if (less(a[j], a[j-1]))
        exch(a, j, j-1);
    else break;
```
Insertion sort: Java implementation

```java
public class Insertion {
    public static void sort(Comparable[] a) {
        int N = a.length;
        for (int i = 0; i < N; i++)
            for (int j = i; j > 0; j--)
                if (less(a[j], a[j-1]))
                    exch(a, j, j-1);
                else break;
    }

    private static boolean less(Comparable v, Comparable w) {
        // as before
    }

    private static void exch(Comparable[] a, int i, int j) {
        // as before
    }
}
```
**Insertion sort: mathematical analysis**

**Proposition.** To sort a randomly-ordered array with distinct keys, insertion sort uses $\sim \frac{1}{4} N^2$ compares and $\sim \frac{1}{4} N^2$ exchanges on average.

**Pf.** Expect each entry to move halfway back.

</table>

Trace of insertion sort (array contents just after each insertion)
Insertion sort: trace
Insertion sort: best and worst case

Best case. If the array is in ascending order, insertion sort makes $N-1$ compares and 0 exchanges.

A E E L M O P R S T X

Worst case. If the array is in descending order (and no duplicates), insertion sort makes $\sim \frac{1}{2} N^2$ compares and $\sim \frac{1}{2} N^2$ exchanges.

X T S R P O M L E E A
Insertion sort: animation

40 reverse-sorted items

http://www.sorting-algorithms.com/insertion-sort
**Def.** An **inversion** is a pair of keys that are out of order.

\[
\begin{array}{cccccccccccc}
& A & E & E & L & M & O & T & R & X & P & S \\
\end{array}
\]

\[
\begin{array}{cccccccc}
T-R & T-P & T-S & R-P & X-P & X-S \\
\end{array}
\]

(6 inversions)

**Def.** An array is **partially sorted** if the number of inversions is \( \leq cN \).
- Ex 1. A subarray of size 10 appended to a sorted subarray of size \( N \).
- Ex 2. An array of size \( N \) with only 10 entries out of place.

**Proposition.** For partially-sorted arrays, insertion sort runs in linear time.

**Pf.** Number of exchanges equals the number of inversions.

\[
\text{number of compares} = \text{exchanges} + (N - 1)
\]

- convex hull
Shell sort overview

Idea. Move entries more than one position at a time by \( h \)-sorting the array.

an \( h \)-sorted array is \( h \) interleaved sorted subsequences

\[
h = 4
\]

\[
\begin{align*}
L & \quad E & \quad E & \quad A & \quad M & \quad H & \quad L & \quad E & \quad P & \quad S & \quad \Omega & \quad L & \quad T & \quad S & \quad \times & \quad R \\
L & \quad M & \quad P & \quad \Omega & \quad T \\
E & \quad H & \quad S & \quad S \\
E & \quad L & \quad O & \quad \times \\
A & \quad E & \quad L & \quad R
\end{align*}
\]

Shell sort. [Shell 1959] \( h \)-sort array for decreasing sequence of values of \( h \).

input \begin{align*}
\text{SHELL} & \quad \text{SORT} & \quad \text{EXAMPLE} \\
\text{13-sort} & \quad \text{PHHELLSRO} & \quad \text{TEX} & \quad \text{AM} & \quad \text{SLE} \\
\text{4-sort} & \quad \text{LEEPHAMSLOT} & \quad \text{SX} & \quad \text{R} \\
\text{1-sort} & \quad \text{AEEHEL} & \quad \text{LMM} & \quad \text{OPRSSTX}
\end{align*}
h-sorting

How to $h$-sort an array? Insertion sort, with stride length $h$.

3-sorting an array

```
M O L E E X A S P R T
E O L M E X A S P R T
E E L M O X A S P R T
A E L E O X M S P R T
A E L E O X M S P R T
A E L E O P M S X R T
A E L E O P M S X R T
A E L E O P M S X R T
A E L E O P M S X R T
```

Why insertion sort?

- Big increments $\Rightarrow$ small subarray.
- Small increments $\Rightarrow$ nearly in order. [stay tuned]
Shell sort example: increments 7, 3, 1

**input**

```
S O R T E X A M P L E
```

**7-sort**

```
M O R T E X A S P L E
M O R T E X A S P L E
M O L T E X A S P R E
M O L E E X A S P R T
```

**3-sort**

```
M O L E E X A S P R T
E O L M E X A S P R T
E E L M O X A S P R T
E E L M O X A S P R T
```

```
A E L E O X M S P R T
A E L E O X M S P R T
A E L E O P M S X R T
A E L E O P M S X R T
A E L E O P M S X R T
```

**1-sort**

```
A E E E O P M S X R T
A E E E O P M S X R T
A E E E O P M S X R T
A E E E O P M S X R T
A E E E O P M S X R T
A E E L O P M S X R T
A E E L O P M S X R T
A E E L M O P S X R T
A E E L M O P S X R T
A E E L M O P S X R T
A E E L M O P S X R T
A E E L M O P S X R T
```

**result**

```
A E E E L M O P R S T X
```

40
Proposition. A $g$-sorted array remains $g$-sorted after $h$-sorting it.

Challenge. Prove this fact—it's more subtle than you'd think!
Shellsort: which increment sequence to use?

Powers of two.  1, 2, 4, 8, 16, 32, ...
No.

Powers of two minus one.  1, 3, 7, 15, 31, 63, ...
Maybe.

→ 3x + 1.  1, 4, 13, 40, 121, 364, ...
OK. Easy to compute.

Sedgewick.  1, 5, 19, 41, 109, 209, 505, 929, 2161, 3905, ...
Good. Tough to beat in empirical studies.

Shellsort: analysis

**Proposition.** The worst-case number of compares used by shellsort with the $3x+1$ increments is $O(N^{3/2})$.

**Property.** Number of compares used by shellsort with the $3x+1$ increments is at most by a small multiple of $N$ times the # of increments used.

measured in thousands

**Remark.** Accurate model has not yet been discovered (!)
Why are we interested in shellsort?

Example of simple idea leading to substantial performance gains.

Useful in practice.
• Fast unless array size is huge (used for small subarrays).
• Tiny, fixed footprint for code (used in some embedded systems).
• Hardware sort prototype.

Simple algorithm, nontrivial performance, interesting questions.
• Asymptotic growth rate?
• Best sequence of increments? open problem: find a better increment sequence
• Average-case performance?

Lesson. Some good algorithms are still waiting discovery.

How to shuffle an array

**Goal.** Rearrange array so that result is a uniformly random permutation.
How to shuffle an array

Goal. Rearrange array so that result is a uniformly random permutation.
Shuffle sort

- Generate a random real number for each array entry.
- Sort the array.

useful for shuffling columns in a spreadsheet
• Generate a random real number for each array entry.
• Sort the array.

Microsoft antitrust probe by EU. Microsoft agreed to provide a randomized ballot screen for users to select browser in Windows 7.

Solution? Implement shuffle sort by making comparator always return a random answer.

```java
public int compareTo(Browser that) {
    double r = Math.random();
    if (r < 0.5) return -1;
    if (r > 0.5) return +1;
    return 0;
}
```
Knuth shuffle demo

- In iteration $i$, pick integer $r$ between 0 and $i$ uniformly at random.
- Swap $a[i]$ and $a[r]$. 
Knuth shuffle

- In iteration $i$, pick integer $r$ between 0 and $i$ uniformly at random.
- Swap $a[i]$ and $a[r]$.

**Proposition.** [Fisher-Yates 1938] Knuth shuffling algorithm produces a uniformly random permutation of the input array in linear time.
In iteration $i$, pick integer $r$ between 0 and $i$ uniformly at random.
Swap $a[i]$ and $a[r]$.

public class StdRandom
{
   ...
   public static void shuffle(Object[] a)
   {
      int N = a.length;
      for (int i = 0; i < N; i++)
      {
         int r = StdRandom.uniform(i + 1);
         exch(a, i, r);
      }
   }
}
War story (online poker)

**Texas hold'em poker.** Software must shuffle electronic cards.

---

How We Learned to Cheat at Online Poker: A Study in Software Security

http://www.datamation.com/entdev/article.php/616221
Bug 1. Random number $r$ never 52 $\Rightarrow$ 52\textsuperscript{nd} card can't end up in 52\textsuperscript{nd} place.

Bug 2. Shuffle not uniform (should be between 1 and $i$).

Bug 3. `random()` uses 32-bit seed $\Rightarrow$ $2^{32}$ possible shuffles.

Bug 4. Seed = milliseconds since midnight $\Rightarrow$ 86.4 million shuffles.

```
for i := 1 to 52 do begin
    r := random(51) + 1;
    swap := card[r];
    card[r] := card[i];
    card[i] := swap;
end;
```

"The generation of random numbers is too important to be left to chance."

— Robert R. Coveyou
War story (online poker)

Best practices for shuffling (if your business depends on it).

- Use a hardware random-number generator that has passed both the FIPS 140-2 and the NIST statistical test suites.
- Continuously monitor statistic properties: hardware random-number generators are fragile and fail silently.
- Use an unbiased shuffling algorithm.

Bottom line. Shuffleng a deck of cards is hard!
2.1 **Elementary Sorts**

- rules of the game
- selection sort
- insertion sort
- shellsort
- shuffling
- convex hull
2.1 **Elementary Sorts**

- rules of the game
- selection sort
- insertion sort
- shellsort
- shuffling
- convex hull
Convex hull

The **convex hull** of a set of $N$ points is the smallest perimeter fence enclosing the points.

**Equivalent definitions.**
- Smallest convex set containing all the points.
- Smallest area convex polygon enclosing the points.
- Convex polygon enclosing the points, whose vertices are points in set.
Convex hull

The **convex hull** of a set of $N$ points is the smallest perimeter fence enclosing the points.

**Convex hull output.** Sequence of vertices in counterclockwise order.
**Convex hull: mechanical algorithm**

**Mechanical algorithm.** Hammer nails perpendicular to plane; stretch elastic rubber band around points.

[Image of nails and rubber band forming a convex hull]

http://www.idlcoyote.com/math_tips/convexhull.html
Convex hull application: motion planning

Robot motion planning. Find shortest path in the plane from $s$ to $t$ that avoids a polygonal obstacle.

Fact. Shortest path is either straight line from $s$ to $t$ or it is one of two polygonal chains of convex hull.
Convex hull application: farthest pair

**Farthest pair problem.** Given $N$ points in the plane, find a pair of points with the largest Euclidean distance between them.

**Fact.** Farthest pair of points are extreme points on convex hull.
Convex hull: geometric properties

**Fact.** Can traverse the convex hull by making only counterclockwise turns.

**Fact.** The vertices of convex hull appear in increasing order of polar angle with respect to point \( p \) with lowest \( y \)-coordinate.
Graham scan demo

- Choose point $p$ with smallest $y$-coordinate.
- Sort points by polar angle with $p$.
- Consider points in order; discard unless it create a ccw turn.
Graham scan demo

- Choose point $p$ with smallest $y$-coordinate.
- Sort points by polar angle with $p$.
- Consider points in order; discard unless it create a ccw turn.
Graham scan: implementation challenges

Q. How to find point $p$ with smallest $y$-coordinate?
A. Define a total order, comparing by $y$-coordinate. [next lecture]

Q. How to sort points by polar angle with respect to $p$?
A. Define a total order for each point $p$. [next lecture]

Q. How to determine whether $p_1 \rightarrow p_2 \rightarrow p_3$ is a counterclockwise turn?
A. Computational geometry. [next two slides]

Q. How to sort efficiently?
A. Mergesort sorts in $N \log N$ time. [next lecture]

Q. How to handle degeneracies (three or more points on a line)?
A. Requires some care, but not hard. [see booksite]
Implementing ccw

CCW. Given three points $a$, $b$, and $c$, is $a \rightarrow b \rightarrow c$ a counterclockwise turn?

![Diagram showing different cases for ccw]

- **yes**
- **no**
- **yes (∞-slope)**
- **no (collinear)**
- **no (collinear)**
- **no (collinear)**

Lesson. Geometric primitives are tricky to implement.
- Dealing with degenerate cases.
- Coping with floating-point precision.
Implementing ccw

**CCW.** Given three points \( a, b, \) and \( c \), is \( a \rightarrow b \rightarrow c \) a counterclockwise turn?

- Determinant (or cross product) gives 2x signed area of planar triangle.

\[
2 \times \text{Area}(a, b, c) = \begin{vmatrix} a_x & a_y & 1 \\ b_x & b_y & 1 \\ c_x & c_y & 1 \end{vmatrix} = (b_x - a_x)(c_y - a_y) - (b_y - a_y)(c_x - a_x) = (b - a) \times (c - a)
\]

- If signed area > 0, then \( a \rightarrow b \rightarrow c \) is counterclockwise.
- If signed area < 0, then \( a \rightarrow b \rightarrow c \) is clockwise.
- If signed area = 0, then \( a \rightarrow b \rightarrow c \) are collinear.
Immutable point data type

```java
public class Point2D {
    private final double x;
    private final double y;

    public Point2D(double x, double y) {
        this.x = x;
        this.y = y;
    }

    ...}
```

```java
public static int ccw(Point2D a, Point2D b, Point2D c) {
    double area2 = (b.x-a.x)*(c.y-a.y) - (b.y-a.y)*(c.x-a.x);
    if (area2 < 0) return -1;  // clockwise
    else if (area2 > 0) return +1;  // counter-clockwise
    else return 0;  // collinear
}
```
